Web hosting is a service that provides space for clients to float their websites on computer servers that are connected, at all times, to the Internet for access by the internet users at any time.

Servers are high functionality computers with extravagant amount of space which can be divided and leased out to the clients for hosting their website.

There is a unique numerical IP (Internet Protocol) address for every server on the Internet. Every server has unique and dedicated space leased out for each of the websites. This space can be then be accessed via a specific address or web address.

CompuBrainTM in association with Patel Hosting can assist in finding out the right amount of space needed for the website and further lease out the same. See the [Domain and Hosting Charges Tab](#) for more information.
