

24 X 7 Monitoring

24 X 7 Monitoring

Any website when running needs to be monitored 24x7 for it run smoothly. Many factors need to be monitored and maintained to keep a website running 24x7 and the one that is error free and secure.

The server on which the website is hosted needs to be kept running and monitored so as to keep the uptime of 99.99%. The webmail server needs to be kept up to date and fully secured as the client's important mails and conversations are stored on to it. These elements need to function consistently so as to provide the benefit of website being online at all times.

Data Server (if any) contains critical back up data or important information of a client. These servers need to be constantly monitored so as to not loose the vital information. These servers also need to be protected against malware and virus attacks and hence should carry appropriate security protocols. Application based website should be monitored continuously to ensure that the very application does not crash and prevent users from operating it. It is a costly venture to have an application based website not running.

CompuBrainTM provides its customers with domain and web servers that have uptime of 99.99%. Apart from being operational 99.99% of the times, the servers are secure as the security policies deployed by CompuBrainTM ensure that not a single virus or harmful attack is successful.
